

## **Yamuna River, an Archeological View**

In the Sanskrit literature, the Yamuna River was portrayed as a Himalayan river of snowmelt water. The people who composed the Sanskrit literature were Greek stooges of South Bactria (Avesta) called Brahmin (DNA Z93) who were ignorant of Hindu (DNA F) history, geology, geography, and culture.

Hindu (F) were rainwater people. They lived only along perennial rainwater rivers in Peninsular India for over 60,000 years. They avoided the Himalayas and its rivers like the plague. All the stories that glorified the Himalayas and its rivers were from the Brahmin (Z93) culture, not the Hindu (F) culture.

A computer-generated map of Indian rivers revealed that the Yamuna had nothing to do with the Himalayas. The Aravalli Ridge, the yellow line in the map, was its headwaters, not the Himalayas. The Yamuna covers the entire area from the Aravalli Ridge to the Satpura Range. It had rainwater no matter which way the monsoon winds blew. The Hindu lived along the Yamuna for 60,000 years.
