

Homo Sapiens, an Archeological View

Modern humans are Homo Sapiens. They evolved 200,000 years ago in Africa. They were split into four different branches called clades and moved out in different directions. Culturally, the Clades had nothing in common. For analytical purposes we should treat them as four different categories of Homo Sapiens.

The Asia Clade were DNA C and F. They were warm-climate people and lived only in the Tropical Zone. They moved from Ethiopia to the Persian Gulf to Punjab to the Bay of Bengal. The C moved on to China. The F stayed in India.

The Europe Clade was DNA R1. They were cold-climate people and lived only in the land of glaciers. They evolved from the Ice Age to the Stone Age to the Iron Age. They were the current Europeans. They moved south only after the global drought of 4,000 years ago.

The European historians were unaware of the Asia Clade. From their perspective, human history started with the Europeans.
