In the Sanskrit literature, the Yamuna river was portrayed as a Himalayan river of snowmelt water that flowed south to converge with another Himalayan river Ganges, at the Prayagraj city. The people who composed the Sanskrit literature were Greek stooges of Persian culture (DNA R1), recent European immigrants, who were ignorant of Hindu History, Geology, Geography, and Culture.

Hindu (DNA F) were rainwater people. They lived only along rainwater rivers. They avoided the Himalayas and its rivers like the plague.

A computer generated map of Indian rivers revealed that Yamuna had nothing to do with the Himalayas. It was a rainwater river that stretched from the Thar desert to the Bay of Bengal. It was a highway of Hindu migration from the Persian Gulf to the Sunda. Hindu lived along the rainwater Yamuna river for 60,000 years.
